Regarding ffprobe, can it do something that ffmpeg can't do if running `ffmpeg -i <input>` to see what type of file something is?

ffprobe allow you to specify the items your interested in and outputs the information in an easy to parse format.

Keyword=value

```
$ ffprobe -v error -show_format -show_streams input.mp4
```

```
[STREAM]
```

```
index=0
```

```
codec_name=h264
```

```
codec_long_name=H.264 / AVC / MPEG-4 AVC / MPEG-4 part 10
```

```
profile=High
```

```
codec_type=video
```

```
codec_time_base=1/50
```

```
codec_tag_string=avc1
```

```
codec_tag=0x31637661
```

```
width=320
```

```
height=240
```

```
... etc.
```
