I'm happy to report that my M-Audio Keystation 61 MK3 MIDI keyboard arrived and it works out of the box 🎉

PianoMeter showed the pressed keys and Horny listed M-Audio as in and out in a settings just from the start. Then I changed output to SoftSyn and voila...the sounds flowed. I have to dig AOS4FE CD out and install Timi.

The size of the keyboard is just perfect. After more tests I will report it as 'working' in "USB devices that work..." thread.

Thanks for everyone involved :)
