Maybe MK2 hit its limits on sam440 because of different factors ?

To be sure that "dynamic" works for you at all, check it via some benchmark. For example PCPBench:

[ftp://ftp.zedz.net/pub/msdos/78.46.141.148/benches/PCPBench\\_DOS](ftp://ftp.zedz.net/pub/msdos/78.46.141.148/benches/PCPBench_DOS).

Just run it, and wait till it will reach 100% (right bottom of screen), and then hit "Esc", so you will see how much fps you have.

Then do the same with "dynamic". If numbers will be different, then dynamic works. If same, then something wrong with config.

On x5000 i have 4.2fps for normal, and 15.2fps for dynamic.

And be sure you test it as it firstly, via running from shell and having pure dosbox.conf. As dunno what runindosbox do with.
