Anyway, check that "str" is a valid pointer before strncpy.

Yep. That could be a problem if it's NULL.

Quote:

Also If "str" points to a string that is longer than 1023 characters, there will not be NUL termination.

That's a good reason to switch to more modern "strncpy". It always terminates the copy with a NULL.

Maybe something like:

```
strncpy(lied.phonolithprojekt, str, sizeof(lied.phonolithprojekt)); (https://linux.die.net/man/3/strncpy)
```

Since "lied.phonolithprojekt" appears in a number of program files, it might be a good idea to initialize it in the structure declaration with something like "unnamed project".
