I also have [this one here](#), a passively cooled R7 250 1GB. Had this in stock and just put it into my X5000, works well but looks as if not all VRAM is being accessed, system reports only 200+ free VRAM MB after cold boot (on a pretty clean system), which is still good enough for me but I probably wouldn't recommend this one because of that.

That's a graphics.library limitation, because it can only use the 256 MB that the CPU can access directly. 3D drivers can use the rest of VRAM if you have RadeonHD.chip v3.
