Any ideas how hard it would be to update the OpenSSL or the Curl being used? Could it be as simple as a rebuild or more involved?

Both are some work for sure, not just `./configure;make`. For curl I remember there were issues, like when you use new curl, it didn't work as expected and changes in odyssey's code need to be done. But is there needs for newer curl at all? I mean not every time when new version out is necessary need it?

For OpenSSL, I for sure can understand to be updated, but 1.23r4 from os4depot use v1.0.1q, so not very old IMHO ? But that one should be more or less easier to build, just, as I remember, that also was issues. You may remember that pure `./configure;make` wasn't enough when we made test version with it, and MickJt was in need to reconfigure it somehow special so to make all works as need it.

But yes, OpenSSL sure can be more or less easily updated, while Curl needs some work (and in odyssey itself probably too).

Now with source code in github, probabaly any developer may try to experiment with other libs. I put in SDK just those ones which i use for release versions, and which 100% works and tested in few years by users.
