Pretty sure it doesn't work that way. The only difference would be that GCC 8 would compile things a bit faster, if it had itself been compiled with GCC 8 with optimizations on, but the resulting binaries it produces should be exactly the same.

There is this though: https://www.amigans.net/modules/xforum ... hp?topic_id=7957&forum=25

But I suspect kas1e has LTO enabled already.
