Spoofing as iphone 13 works great with youtube. ;)

A "little thing" you should add that I find annoying is in the "Download Fonts" script in the Odyssey folder, everytime I make an fresh install and "install" Odyssey I run the Download Fonts script, and it always fail until I add --no-check-certificate.

The fix as you know is to add

```
--no-check-certificate"
```

on line 23 in the script after -

```
echo >t:fetchfont{$$} ".KEY F*NDatas/wget --tries 10 --waitretry 10"
```

So an reminder or a choosable option in the script would be great!
