What is asyncio.library for anyway?

"provides DOS-like functions for using double buffered asynchronous IO on files"

In odyssey it used for open/write/etc files, there:

[https://github.com/kas1e/Odyssey/blob/ ... e/Linux/BCFileIOLinux.cpp](https://github.com/kas1e/Odyssey/blob/...e/Linux/BCFileIOLinux.cpp)

It surely can be rewritten on amigaos4 native probabaly, as we can expect that today's DOS should do it all what asyncio do. Its just for MorphOS and AmigaOS that all used often, and it just works for os4 port as well, without needs to tinkering with "if our public DOS can do that all already what asyncio do, and if it worth to worry about at all".

I do get a lot of
LIBS:muimaster.library:GroupDispatcher
lately (since the updates) but that might be only me and i also don't have a reproducible case yet.

Be sure you use beta02, and be sure you use latest mui. But if both are meet, then it probabaly that one:

<http://muidev.de/ticket/428>

So try to save crashlogs , and compare if they the same, as well as take latest debug version Thore attach to the ticket and try to follow his steps he ask to provide more usefull crashlogs.
