Odyssey 1.23 r5_beta03 - AmigaOS4

Very nice. Thanks for all the work!

Just did some quick testing of APNG's and webm videos. All worked quite well. Did a google search on animated PNG graphics and play many of the APNG files that came up in the search without any problems.

Found a couple of websites to test the embedded webm playback. The good old Buck Bunny embedded webm video can be found here:<https://www.webmfiles.org/demo-files/>

I also found a site that let's you change the embedded webm video resolution on the fly. Just click on the video and click the webm control at the bottom.

https://commons.wikimedia.org/wiki/File:Volcano_Lava_Sample.webm

360p plays great with the X1000. 480p starts to struggle a bit.

The Webm videos I tried so far seem to work great!

This site also allows switching to vp9 format and they play but they are much more processor intensive so the sound can get lost.
