Also what make me curious : i tested video of webp which you point out on (that with Lava one), and there i can choice any format : webp, vp8 and vp9 too, and all works. But in prefs/media we have string "WebM (VP8) support", but then , should't it be "WebP (VP8,VP9) support" instead ?

VP9 Codec is the successor to VP8 and was released in 2017. Since we can play it, go ahead and add it.
