On my X-1000 the video on test page from samo79 play better than beta 3 with 10-20% lower CPU usage.

I can confirm I'm seeing about a 16% increase in play speed on my X1000 with Beta04 but I do get the occasional crash. I can click on Ignore and the video goes on playing fine. On my X1000 360 videos play smooth with about 70% cpu usage. Theater mode (854x480) plays Ok as well with about 95% to 100% cpu usage. The video isn't quite as smooth as 360 but it's definalty watchable and the audio stays is sync. At 720p the audio start so studder and the picture is definatly a jerky. It's great to be able to play in the browser but I still prefer using YT with external MPlayer. This is good for when that doesn't work though. Of course all the improvements are great!

I think the crashes mostly occrus if I try to do other things while the video is playing. Like searching in the video, or changing resolutions. If I just start it playing and just watch it I think it's pretty stable.
