The Clock v.53.29 can cause a problem with MUI programs when dragging objects, resulting in a system freeze. If I open the clock on WB screen in analog (with arms) mode, and then open e.g. YAM and try to drag an attachment of a mail message to a disk, I get a system freeze (mouse and keyboard do not work, the clock stops). Also Odyssey shows similar problems. This issue is 100% reproducible in my X5000.

If I change the clock mode to analog or go back to v. 53.21 Clock, the problem disappears completely.

According to the analysis of Thore Böckelman (<http://muidev.de/ticket/431>), the new clock version seems to use for unknown reason 'global screen locking', which causes a conflict with MUI programs used on the same screen. I'm not programmer, so please have a look in that ticket to see more details! There are also a couple of workarounds mentioned in it.
