@Raziel

First of all thanks for the reply 😊

May you help me please? i get lost, sorry pal but i am really a newbie about midi and timidity. I just installed Timidity and, if i remember well, i just did an assign and so i can play midi file using gus library(is it correct to call gus directory a library of sound?) and hear midi sound when i play doom.

I didn't know, reading the config file, that I can improve the gus library with better sound fonts??

About AmigaAmp, sorry pal, but I didn't understand exactly what I have to do..

1) I have my Timidity installation with inside the gus directory in the Work2:Musica/Timidity (that's the path)

2) i create a timidity.cfg file with the text you put above and then? where I put that config file?

3) and sorry here i create the myconfig.file and then?

if you wish i can send you an email ..

Thanks 😊
