Hi kas1e,

Thanks for the latest beta and your work.

And the latest spoofing added

I don't really know the Odyssey story, having no hardware for amigaos4.1FE and before you started the new work on the new versions it was slow to be used with winUAE.

Now he works very well.

I took a look at the Cygwin guide for how to compile the sources for amigaos-ppc, I used it a long time ago for other things.

Are the current sources in the public domain and freely editable?

Thanks again for a possible reply.
