Solved the problem, I had to make some changes in winuae.

And oddly once I configured the E-UAE file I had to set the write protect flag.

Probably I was wrong, but every time the file was overwritten adding an additional partition also of 4.1

protecting it from writing now everything works perfectly E-UAE, Odyssey, ffplay etc. without crash

I don't understand why if I don't protect it from writing every time it also adds the 4.1FE partition.

However now it works.

here the video, if it can be useful

Thanks again for the advice.
