@kas1e

Thank you for your hard work and all the amigans involved.

I've been using beta06 for a week now and is really faster than the old 1.23 (just like the other betas, after recompiling & updating the includes). I could not extensively test the player due to CPU limitations (Sam440Flex here), but it reproduces every video nicely (any hints/optimization settings for low CPU power? There was a script time ago, that optimized youtube settings).

I've noticed also a 100%CPU usage, when the OWB-Timer subtask runs.

Now a MUI thing maybe : I have Odyssey running on its own MUI screen. When switched to full screen, it stays on its own screen and returning to normal window goes to the Workbench screen automatically. It will not switch back to Odyssey screen even if I choose to do so directly, instead I have to choose WB screen first (the window is already there) and then its own screen.
