I asked AmigaKit to help me find a new graphics card for the SAM460 and they've sent one in the post. Will I need to install drivers for it in my current system before installing it physically? They sent me a Radeon R7 240, but after reading here I'm worried it won't work, although I doubt they'd send a card which was not supported. I presume I should get one of the Enhancer packs for this one? I still find the whole thing with the different Enhancers and Radeon drivers and the lot quite confusing, even after reading thread here on Amigans. Thanks in advance. :)
