Thanks for the info on the cards.

I've tried the card now. It is a VTX Radeon R7 240 with 2 GB of RAM.

Have the Enhancer Plus (the one available now) with the RadeonHD driver installed.

The OS boots to Workbench, but after a second everything freezes.

When booting with no startup sequence, I can type in commands etc., but as soon as I try to run a program it freezes again.

Have tried VGA, DVI and HDMI.

Only thing I haven't tried is buying and installing the latest Radeon HD drivers from the upgrade pack they are offering. This pack contains RadeonHD 3, while the one with enhancer is RadeonHD 2.

Now I'm back to the old card, which works well except for 3D. :)
