zmodem transfers from OS4.1 FE

Hi there.

I'm trying to transfer some files to my A500 over a serial cable.

My hope was that term 4.8 would do it but whenever selecting "transfer binary file(s) my machine will lock up hard. (X5000)

So what i'm looking for is advice about how to get zmodem transfers working from Term 4.8 or an alternative way to do it.

I remember from a few years ago when i just wanted to be able to capture serial debug output from another machine that there was not many options for serial communications for os4.1 (iirc there was only term 4.8 and the archive from aminet would not even run without doing some tweaking at first).

Maybe there is some tweak needed to be done to send files also? I can recieve and send text between the computers when typing on the keyboards.

So does anyone know any alternative ways to send my files, or does term 4.8 work for you or if there is something that can be done to term so that it will work?

This A500 is running aos 1.3 and ncomm and at the moment i'm hoping to not have to replace ncomm with any other software as it would be easier if i could get zmodem transfers to work from the X5000.
