@NBache

As i say you should install beta7 to a fresh new directory, and then conf by conf update it if you wish from old install. In new one not only new pixman library come, but also useragent.prefs, which contain all the old spoofing string with the same names as before, and they looks the same in menu.

@All

Recieved another report from another user, who find that "default setting" of spoofing behaviour ununtuitive and unlogical.

What about we just make it as ktadd say : removing it at all, and let the pref's spoofas default reflects in the menu ?

I.e. we can do it like this:

1. Remove "deafult settings" from spoof as menu. The preferences "default" will then reflect the actual default in menu and mark it.

2. Instead of "default settings" we create "environment seting". Then, that one will be marked, if OWB_USER_AGENT set or used.

And then everything clear and understandable.

Just as it now its really non-user logic, but programmer-reverse-logic :)

@Javier

Quote:

IIRC you can have a default useragent, that doesn't show in menu.

Also, we can make that set "default" will automatically make it as "shown in the menu" , too.
