@Javier

I still don't get it. And if i didn't get it , it mean casual users will not too, and we need to do something about for sure. Name it differently, rework, or whatever.

Quote:

1)Prefs SPOOF AS just let the user add useragents and from such list, then activate/enable the DEFAULT and let other be shown on the MENU.

Why we need that way ? Prefs SPOOF AS should let the user choice what they want right now, and "default" should be reflected in the menu. And that all. Other ones can be shown, or not shown, does not matter. Just if you set as default anything from the spoof preference, then it will be shown in the menu in any case.

Quote:

2)The MENU has the list of SHOW IN MENU items from the list and let the user change the useragent to use to the site/web page is browsing.

Yes, and then we can made that if any entry was set as "default", then it will automatically be "show in menu" and can't be changed until default is set.

Quote:

Then if a site/web doesn't load looks ok, then use MENU spoof list to use whatever useragent you want and reload page.

When you find the "correct" useragent, then use URL Prefs. to indicate the URL and SPOOF to be used.

When you choice then any new "SPoof as", it then changes as expected in menu + change the default in the preferences until restart. And all logical then : everything reflect each other and all fine.
