If you launch a pre beta07 version you should see those spoofing useragents in URL prefs. Then in beta07, just go to new prefs->SpoofingAs and enable (show in menu) those useragents that you have/use in URL prefs.

"Problem" is that url prefs (url.prefs file) only saves the index of the useragent not the full string.

Pre beta07 no problem, all was hardcoded into Odyssey and you couldn't change/add/remove spoof useragents.

So if you have a different "enabled" usersgentlist it will change/use the "enabled" useragent at index of the list in prefs->SpoofingAs.

Just if you hex edit/view url.prefs (0x01 usezd as delimiter of each option):

<url_pattern>0x01<javascript>0x01<images>0x01<plugins>0x01<useragent>0x01...

the 5th value/number after the <url_pattern> is the index of the useragent.
