Not sure if it's possible, so i'll post here first before opening a FR.

MultiEdit 1.12 (05.03.2019)

Sometimes i got really long text line with no line breaks (i.e. c&p from websites) and i have to manually set linebreaks to make them readable from within Notepad/MultiEdit, since both programs simply print the line as long as it is, which makes it hard to read and edit.

A workaround would be to use MultiView(er), but i cannot edit the text there.

My question would be, is it possible to add an option to MultiEdit to set linebreaks automatically at a given position, f.e. on column 80, and let MultiEdit figure out where to set the breaks for the whole text?

I'd be happy with a simple "word-breaking" mechanism (set the break between full words, but always respect the maximum column setting), but if it's doable a "word-splitter" would be neat as well (split words in "half" were allowed, while still maintaining the maximum column setting, e.g. astro-nomy).

edit:

It's more or less "word-wrapping" but not "as-you-type" but performed on a load text.
