No, there is no terminal available for AmiCygrix so far.

The easiest way to launch a Linux application on an AmiCygrix display is this:

1. To add permission to run an application on (e.g.) AmiCygrix display 0, add a new line to "Cygrix:CygrixPPC/etc/X0.hosts" and add the IP of your Linux machine.

2. Launch the application (e.g. xterm) like this on your Linux machine:

```
xterm --display=Amiga-IP:0
```
