@Rigo

replace it with "[amiupdate.codebench.co.uk](https://amiupdate.codebench.co.uk)". This should fix your public update problems.

That's what I needed. Working now. Thanks, Simon.

Yeah, Updater pops up asking for my AmiSphere password and login. I enter them, hit return, and then it asks me to enter them again. I hit return, and then get a DSI. If I try to ignore the DSI, I get an ISI and need to reboot. Hopefully a phone call to Amigakit /Matthew will get that sorted out.

Paul
