Pinball rules!

Visual Pinball is not portable, it's 100% Windows application. Direct3D, Visual Basic and so on. Somebody would need to rewrite the rendering engine, GUI, scripting systems, everything. There is no Linux port as far as I know.

Emilia is another open source pinball but it hasn't been developed very actively. I tried it on a Linux box a year ago and based on that, better stick to Amiga classic flippers, unfortunately. The available tables were quite boring. But it's the only portable option from open source.
