Soliton - Getting REKO cardsets to work

Earlier today I gave the game Soliton (<http://os4depot.net/?function=showfile&file=game/card/soliton.lha>) a try and I think it was very good.

I read that it supports REKO cardsets, which I remember having used with Klondike AGA on the A1200 back in the days.

I installed the REKO datatype on AmigaOS 4.1 and copied REKO cardsets to the graphics folder of Soliton, but sadly the sets does not work. Only get blank cards with numbers/descriptions on them.

Anyone knows how to get this working? :) Thanks in advance!
