Hi all

Can you share your experiences with RadeonRX driver and Radeon Polaris Graphic Cards

I have tried Asus Arez RX550 - 2GB and MSI Radeon RX580 - 8GB on my X5000.

But I have returned to R7-265 since it is supported by Warp3D-SI. And R7-265 is faster than RX-550 in real world PC benchmarks :)

Both of them boots to workbench without problems and has smooth performance in 2D operations and 2D games.

RX-550: All the latest Warp3D games Nova work fine.. e.g. Spencer runs at 60 fps. SuperTuxKart, Barony, Foobilliard e.t.c is working fine

RX-580: It has problems with most of Warp3D Nova games. -Spencer shows blank screen and freezes the system.

Barony starts then freezes the system.

Interesting Warp3DNova Logo demo works fine on RX-580.
