In brief, if it c++, then use `-D__USE_AMIGAOS_NAMESPACE__` when compile source.

If it C, then the only solution is to rename those conflicting names in your code (like finding out in all the files where the word "Image" happens to be and rename it to something else like "_Image"). Alternatively, as Salas00 says in the second post of the thread I pointed out: avoid including AmigaOS includes in such files that have these conflicting definitions. But that IMHO harder in comparison with just renaming all "Image" words on "_Image".
