URL:

utf8ToLocal()

expects as input/argument a CONST CHAR\* "utf8ToLocal(const char \*in)"

and it returns a CHAR\* "char \*AmigaOSDialogManager::utf8ToLocal()"

```
"char *newTitle = utf8ToLocal(utf8Title.c_str());"
```

Input is/seems a const char\* "utf8Title.c\_str()"

Result is char\* "char \*newTitle".

Those kind of warning aren't much of important, just only "expects" data to be "read-only" (const) so you don't change on your function/code and broke something.
