Updater won't run

Author: : Paul

URL:

Amigakit helped me straighten out my AMIsphere password issue. . . more or less. They asked me to remove the A-EON directory from ENVARC:

Well, now I can log into AMIstore. But even though the password works with AMIstore, I can't get Updater to run. Before deleting the ENVARC: A-EON directory, Updater just kept looping and asking for my credentials over and over again.

Now that I have deleted that directory, Updater (and the mouse, system) freezes as soon as the window opens.

I've tried running Updater also from the downloaded Enhancer pack software, and from the shell. Doesn't make any difference. Hard reboot before each try.

Help, please!

Paul
