I have an AMD Sapphire Radeon 6450 in a Sam460ex with Radeon HD driver 2.22. It works nicely so far, it's half height and passively cooled but I don't think it works with Warp3D Nova. Everything else works though. Does anyone know a better card that is still passively cooled (i.e. silent) and half height/low profile?

The main problem I have is just HDMI port does not work, but DVI does so I can still use that.
