@Tuskagee

I got one of these off ebay and just put it in my sam 460ex today.

WirelessManager reports successful wifi connection if i put it in verbose mode or run it manually rather than in startup.

I created an networkinterface and set it to dhcp, and shownetstatus reports it has an IP and gateway and dns assigned.

But no traffic is flowing, even if i do a DOWN/UP or a OFFLINE/ONLINE with configurenetinterface i can't ping and i can't do DNS and no browsing works, but it works of course over wired interface if I plug that in and enable that instead.

What am I missing?
