Yesterday i downloaded update 2 i ran into problems having also installed Enhancer 1.5 but this is not a problem i will do a clean install again.

Even if I use winuae I just wanted to ask this because in the changelog I didn't find anything in the "device" section

It seems that G-REX is no longer supported if I select G-REX as PCI no more "sb128" audio is detected and even the RTL8029-PCI network.

But if I use MEDIATOR everything works.

Not a problem this I just wanted to know if G-REX is no longer supported.

I did a clean install with MEDIATOR and everything works

do you know if G-REX is no longer supported because I didn't find anything in the changelog?

Thanks

separate note:

with update 1 G-Rex it worked

**SOLVED**

sorry i solved,

the startup-sequence is modified by update 2

it was enough to add again:

C: BootLoader COMMANDLINE = "GreX NoRamPager NoDiskPager"
