If you have Radeon RX you may have hard times: there no RadeonRX lite driver in the OS4. So you need to modify install ISO to add Radeon RX driver + add kick layout line.

If RadeonHD, then all fine, you will have a lite driver (limited to 1024x768), which you can replace just by copying RadeonHD 3.7 driver over old lite on in sys: kickstart/ and reboot (then screen mode, check 1920x1080 here, if not, choose "detect automatically" or add mode manually, all in screen mode prefs).

After that warp3dnova, warp3d SI (for old warp3d/minilg, not part of Enhancer), and ogles2.library, and so on.
