A more likely solution is a plugin that detects and repairs pops in a given sample or selection.

Yeah, I've seen that feature offered in some programs (mostly on other platforms, but I think SoX can do it too).

I just feel more in control when I can see the changes I make one by one and make sure they are not a sound that is supposed to be there (some percussion instrument or something).

Although I have to admit the few times I've actually used a manual waveform editor (in Exact Audio Copy on a PC) to fix up a sample of a pretty scratched vinyl track, it has taken much too much of my time, so maybe it's time to weigh the pros and cons of the automated approach.

Best regards,

Niels
