X5000 No Longer Booting OS4!

I've had my X5000 working great for quite a while now. After being turned off for several weeks it no longer boots anything. It will power up and show the initial X5000 screen, the boing ball will spin and it will then turn to a gray screen and sit. If I do nothing it will reset itself and repeat back to the X5000 logo. I can interrupt the boing ball and get into u-boot and interact just fine. If I load OS4 from u-boot menu It shows "Loading finished ##### 100%" message comes up after a short time. The next Line reads: "About to call loader entry at 0x7BD02020" at which point it just hangs there.

NO media will boot into OS4. The original CD, my recovery USB stick, or the SSD in it with OD4 installed. The last time I used my system it was fine. I didn't make any changes to it. It's sat and now doesn't work.

The odd thing, if I put in the other GPU I have that supports MorphOS and connect the 2nd SSD I have with a clean install of MorphOS on it, it boots fine into that. SO... This is something OS4 related it seems that came up from nowhere. I now have my system back to stock and am still trying to get it to boot into OS4.
