That sounds like a bug in SimpleMail, it shouldn't be adding a new app icon each time.

Maybe SimpleMail isn't doing it right but the resulting behaviour is different from update1 to update2. In update1 the app icon gets placed over the existing app icon, effectively replacing it. In update2 the app icon gets placed in the next available position due to the new positioning code, thus creating a new app icon each time. The new behaviour is not backward compatible. Not suggesting Simlmail is doing it right though.

So sounds like SimpleMail has fallen foul of a fix that fixed arrangement of icons, which should never overlap.

Quote:

Are applications supposed to remove the old app icon before creating a new one?

Yes, except in rare circumstances, sounds like simple mail is just piling them up on the same spot, slowing draining resources.
