If you call your file name as `.c`, then when you will try to compile with `ppc-amigaos-gcc`, you will fail, as a compiler will think it pure C and will not include CPP includes (if at the end of include there are no `.h`, then its cpp includes).

So, you have 2 solutions :

- 1). rename the file so it will be `.CPP`, and then you can build it and with `"gcc"` and with `"g++"` binaries. Through when you will build it with `"gcc"` you must add at the end `-lstdc++`
- 2). didn't rename it, keep as `.C`, but then build it with `g++` binary.
