Wow! Did you apply patches from adtools which were done for early versions of GCC in full? If so, I may try to build Odyssey with it as well!

Dare I ask if you are willing to deal with some issues later ?:)

I also see you disable gcc17++ in gcc9 due to clib2 limitations, but what about newlib ? (basically, most stuff on os4 use newlib, clib2 for vim was mostly as an exception)

edit: and last question, in gcc10 threading disabled, is it mean whole threading (-athread=native and stuff), or c++ threading?
