It looks like we have c++17 and threading on gcc 9 now. But there seems to be a deployment problem left. As someone who has only done c++ on other platforms, I would expect my 'hello world' to be linked using just -lstdc++. But in this case that will lead to undefined references to `__gthred_*`. In the archive created by adtools there are thread model object files named `gthr-amigaos-native` and `gthr-amigaos-single`. If I link them as well everything works. But I must be missing something here?
