Did you try the drive directly added to SATA instead of through USB?

It doesnt have to be a file system issue...it could easily be a usb driver issue...at least there were updates to the usb driver, so it may easily be an oversight or a new introduced bug or even an already known, but not yet fixed bug.

The only way to get your data from the drive, as far as ican tell, is to plug it to another amigaos4 machine...or maybe uae, where os3.1 plus sfs should be sufficient.
