Great! I write all documentation in Markdown on my Windows laptop, then export in various formats using Pandoc. Would be great if we had a Markdown editor for OS4 so that I could use the PC less.

Installed and running but when opening an .md file written on a PC, the program adds too many empty lines after a paragraph. Perhaps AmiMarkdown is unaware that the PC uses the CR+LF control character combination for a line break, while AmigaOS only uses LF?

And... yes, you should think of a new name for the program 😊 Ami this and Ami that really sounds clueless 😞
