AmiUpdate runs fine on my SAM44-flex and AOS4.1 Update 6.

The Amishere prefs from Enhancer Software Core V1.1 locks the system.

The Updater from Enhancer Software Core V1.1 used to lock but now produces a grimreaper on ramlib.

This is on a clean system. So I did a clean reinstall of AOS4.1 up to update 6 (minimum requirement for Enhancer software Core V1.1.)

AmiSphere Server seems to run fine. Or at least it doesn't lockup my system.

I was hoping that upgrading to FE would solve this problem. FE is on its way right now, but apparently it doesn't
