

---

As I can see it only 1-time call ObtainSemaphore from the `__gthread_entry` at the end. Probably that why we have 1 thread from debug output passes, but the other 3 never happens, and waiting forever for a 3 threads to answer. At least how I understand the output.

It also looks like we send it 4 times `CTRL_F`, but only one is received (right?)

Interesting also, that at first, we have clean `ObtainSemaphore()` call from `__gthread_create`, without anything else, but then all next ones mixed with `CTRL+F` checks, but dunno maybe that expected to be like this.
