No lockups over here what so ever except if I disable GUI effects then total freeze of my X5000.

Do you have an fresh install or installed over old X5000 install?

What version of Updater are you using? I am having no issues on my X5000 with Updater v53.70 with a fresh install of os4.1FE upd2 + all latest public enhancer files.

The only way I got a crash when turning compositing effects off was for an app that was already running in Amidock. Never a full system freeze.
