Apparently there are dependancies that you have have and others don't.

I run a clean reinstall of Amigaos4.1 update 6 on a sam440.

Installed Enhancer Software Core V1.1 with the following version numbers:

- Updater 53.7
- AmiSphereServer 53.37
- AmiSphere 53.37
- kernel 53.58 (received through amiupdate)

AmiSphere locks and updater gives a grimreaper.

I know that I do not run FE yet (Ordered 440ep version from Alinea and will arrive once DHL decides that they took enough preparation time to finally send it "international" within a "borderless" europe (5 days and counting);

Amigakit warehouse is this huge that it already takes 3 days to pick the X5000 order) but it is supposed to run on 4.1 update 6. I also know that the core edition is free of charge. Is it free because it doesn't run anyways?

Was it not tested but just assumed to work on 4.1 update 6? Nobody involved on amigans or amigaworld care to comment on this issue. But from what I read in this thread, FE will not solve the issue either.

I am a returning user, so i knew that it wouldn't be a walk in the park. But try to imagine the frustration of new users.
