For example, for now, just fire up the updater, and it lockup on the running, just showing me an empty grey window.

I don't have amispehere running by default, so it runs as well when I Dbl-click on updater from amidock. Also, it can be related to some settings inside of amidock, dunno. But what is for sure, is that it lockups from time to time. If any Enhancer devs (like Trixie or Andy) is interesting to fix it, I can then made good tests/bug-reports, if nope, then it not worth time spending on bug report no one will deal with :)
