Version number is in the filename of the .so object, if don't have file you don't have the version, program does not start, that's how works on Linux, the file without version numbers are soft links that point to file with version number. Bad programs will use the file without version numbers, but then elf loader will noticed that it has missing linking to functions.

Not sure about dynamically loaded .so files, programs that use .so files as plugin, however I know its documented.

I have noticed that Amiga developers put Amiga version strings into the strictly linked clib's *.a files, this is wrong as now program gets that version string from static linked library.
